

Problem Statement: Student Database Management System Using Doubly Linked List

Develop a Student Database Management System using a Doubly Linked List in C++. The system should maintain student records, including Student ID, Name, Roll Number, Age, and Department. It should provide operations to add new student records, display all student records, search for a student using their ID, and delete a student record. Each node should contain pointers to both the previous and next nodes, allowing efficient traversal and proper updating of links during insertion and deletion. The system aims to demonstrate the practical application of doubly linked lists in dynamic student record management.
