Problem Statement

PROBLEM STATEMENT

Title: Comparison of Two General Trees

Write a C++ program to construct two general trees and determine whether they have the same structure and corresponding node values.

Suggested modifications:

1. Report whether the trees differ in structure, values, or both.
2. Display the first pair of corresponding nodes that differ, including the location and values when available.
3. Compare node counts and heights as additional checks.

Assumptions:

- Node 1 is the root.
- Every non–root node has exactly one parent.
- All nodes must be reachable from the root.
- Child order is significant.
- Height is measured as the number of nodes on the longest root–to–leaf path.
