```
===== COMPARISON OF TWO GENERAL TREES =====
Child order matters.
Height is measured in nodes.

Enter number of nodes in Tree 1: 3
Enter value for node 1: 1
Enter value for node 2: 2
Enter value for node 3: 3

Node 1 is the root.
Enter child count and child IDs for each node.
Number of children of node 1: 2
Enter child ID 1 of node 1: 2
Enter child ID 2 of node 1: 3
Number of children of node 2: 0
Number of children of node 3: 0

Enter number of nodes in Tree 2: 3
Enter value for node 1: 10
Enter value for node 2: 90
Enter value for node 3: 77

Node 1 is the root.
Enter child count and child IDs for each node.
Number of children of node 1: 2
Enter child ID 1 of node 1: 2
Enter child ID 2 of node 1: 3
Number of children of node 2: 0
Number of children of node 3: 0

========== TREE STATISTICS ==========
Tree 1 - Node count: 3, Height: 2
Tree 2 - Node count: 3, Height: 2
Node counts: MATCH
Heights: MATCH
```

```
========== COMPARISON RESULT ==========
Result: Trees differ in NODE VALUES only.
First difference: Value mismatch at root: Tree 1 = 1, Tree 2 = 10.
Note: Matching node counts and heights do not prove that trees are identical.
